03

User side · Merchant side

About Me – Left brain: data. Right brain: story.

BRIEF INTRO

MSBA @ Santa Clara University · Marketing Strategy & Operations

Marketing Analyst at Top Streaming Platforms in China · Founder of TUTU Academy · Building AI Agent with Lam Research

Content Creator on RedNote & YouTube

PAST PROJECT

A Previously · Founder **TUTU Academy**

Grew from 0 → 70K followers through content
3,000+ paying users · 1,600-member community
Iterated product directly from user feedback loops

B 2026.01 – 2026.05 · Lam Research **Competitive Intelligent AI Agent**

Built end-to-end AI agent for Global Product Marketing team
Cut routine competitive-research time by ~70%
Ramped on semiconductor-equipment domain from scratch
Cross-functional with IT, Marketing, and leadership

WHY THIS ROLE

1 Why S&O

The S&O playbook: strategy → ops → impact.
I love that the role is close to business and owns
the call AND the result.

2 Why Uber West

Eats × PM is a real portfolio puzzle.
At Uber, there are best practices in dealing with
massive data.

3 Why Now

“In the Know” — the brand awareness PM is
leveraging.
Bring my content, growth, and social media
experience here.

Food delivery isn't one national market — it's 44 city-level battles, played with Uber's two-brand portfolio.

US food delivery · 2023

~\$80B

Gross order value · third-party platforms

US national share · 2023

Sources: Bloomberg Second Measure / Earnest Analytics / Statista, 2023.

44 US metros · Uber combined gross bookings

Color depth = Uber (Eats + PM) gross bookings

Source: Case dataset (single-month sample, 2023).

Today's three moves

Map

Diagnose city health — how Eats and PM each grow.

Move

An Eats × PM retention pilot in LA.

Multiply

Uber One LTV — a cross-category bundle.

Map — read each city by how Eats and PM each grow

Eats and PM aren't the same brand —

Hypothesis: PM is a differentiator capturing users, occasions, and merchants UE structurally cannot.

1

Reach

Brand pull in a price-sensitive market

- **60%** of US delivery users **multi-home** (CivicScience 2023)
- **77%** of UE users **also use DD** (Earnest Analytics 2023)
- PM is one of the few brand-pull platforms

2

Curation

"In the Know" — premium merchant mix

- SMB: **PM 85% vs UE 79%**
- AOV: **PM \$32.57 vs UE \$28.99 (+12%)**
- UE more constrained by chain Plus/Premium commission tiers
- PM users describe it in "premium" terms

3

Occasions

Late-night, alcohol, "Anything"

- LA-origin brand with strong **influencer ecosystem**
- PM's marketing has owned **late-night, alcohol, and "Anything"** occasions
- UE has the products but no equivalent social tone and user mindset

Sources: Case dataset (SMB / AOV / GB) · CivicScience 2023 · Earnest Analytics 2023 · PM brand history + social listening.

Caviar parallel — DoorDash kept its premium-curated brand separate for 5+ years post-acquisition

~20 urban-premium markets · no fast food, no grocery · only 4+ star Yelp restaurants · Michelin / Zagat / Infatuation partnerships

The 1+1>2 portfolio logic applies — PM isn't a supplement to UE, it's a niche asset with a distinct user profile.

DIM playbook — Eats × PM gets a different action in each tier

PM = 10% of Uber US food delivery (GB-weighted, 2023)

Threshold logic: 20% = PM is strong locally. 5% = below this, PM presence is too low to justify dedicated retention spend.

Tier	Rule	Strategic action
Defend 2 cities	PM share ≥ 20% AND combined YoY ≥ +11%	PM is a local stronghold and the city is healthy, both brands invest to protect PM's identity and watch for chain encroachment from DD.
Investigate 14 cities	Combined YoY < +11% AND PM share ≥ 5%	1+1>2 priority tier, we run the retention pilot. PM uses brand-pull + curated supply to retain at-risk users UE recovers convenience-driven volume.
Maintain 11 cities	PM share 5–20% AND combined YoY ≥ +11%	BAU operations, no new retention spend. Monitor PM share trend (move to Defend if ≥ 20%, Migrate if < 5%). Use as test markets for tactics that scale to Investigate.
Migrate 17 cities	PM share < 5%	UE-led growth; consolidate PM operations. Operational cost of dedicated PM retention not justified at this presence level.

[Per-city tier assignment + bubble chart in the interactive dashboard →](#)

Move the metric — PM Active Eater pool retention

Hypothesis: AE retention is the upstream lever — moving it lifts the rest.

Active Eater retention — shaped by 3 levers:

AE retention (*primary lever*) · NE → AE conversion (*early retention*) · NE acquisition (*top-of-funnel*)

PM user-base YoY — June 2022 → June 2023

Why AE retention is the primary lever:

- Biggest base** — 13.5K AE/mo vs 1.1K NE/mo (12× larger absolute lift potential)
- Reusable playbook** — retention mechanics scale city-to-city; acquisition needs per-city redesign
- Compounds into LTV** — retained users order for years; we capture the multi-year LTV, not just a single order

Spend gap — PM vs UE

Existing-eater incentive (% of GB)

\$ per Active-Eater-month

PM spends +48% more per user, yet bleeds more.
Hypothesis: Segmentation is the gap.

Size of prize — start in LA, scale to Investigate cluster

LA PM annualized decline

~\$1.42M

per year of LA PM Gross Bookings at risk

Methodology

Annualized run-rate

Jun 2022 PM GB: \$1,020K / month
Jun 2023 PM GB: \$903K / month
Monthly gap: \$118K × 12 = \$1.42M / year

Scenarios — LA pilot (Y1 GB defended)

Scenario	Assumption (Industry benchmark: + 1-4 pp)	Y1 GB defended	AE pool saved (Y1)
Conservative	+1pp retention · 41% arrest	\$568K	~510 AE saved
Base	+2pp retention · 87% arrest	\$1.21M	~1,234 AE saved
Optimistic	+3pp retention · full arrest	\$1.42M	~1,427 AE saved

Investigate Tier Scale-up

Investigate tier (14 cities) = \$3.1M / year annualized PM GB decline.
At Base +2pp retention cluster-wide: \$2.7M Y1 GB defended, ~2,700 AE saved

Industry context: DoorDash 2022 = -\$1.4B net loss; Uber Eats 2022 first EBITDA-positive at 5% margin.
GB is the short-term defense. The 3-year LTV view across the ~2,700 saved AE is the real strategic prize.

LTV — the compounding prize

DECISION-DRIVEN LTV — 3 SCOPES

NARROW

PM standalone NetRev only

\$114

Conservative ROI floor

CROSS-PLATFORM

PM + UE + attributed Rides

\$150

Retention engine value-tier scoring

SUBSCRIBER

Sub member with frequency lift × cross-platform

~\$292

Sub-conversion economics

UBER ONE —

Cross-category bundle

Eats + Rides + PM in one membership.

DashPass cannot match this — it's delivery only.

~12%

PM sub penetration today
(case data: \$273K sub rev / 222K user-mo / \$9.99)

vs DashPass ~40% on DD → **~3× headroom for sub-driven LTV uplift**

Apply LTV to Scenario 'BASE'

Saved ~2,700 AE × \$150 cross-platform LTV

= **\$405K 3-year LTV uplift**

with 20% Uber One conversion: **~\$482K+**

[Full methodology & formulas in the LTV calculator →](#)

Retention engine in LA

Hypothesis: Precision matching of user signals to promo design lifts PM AE retention by ≥ 2 pp in LA.

The matching engine — daily batch (co-designed with Marketing team)

USER signals (input)

LTV tier historical value (90-day NetRev $\times$ forward potential)

Churn risk recency $\times$ frequency-drop $\times$ engagement signals

Behavior order time, merchant preference, AOV pattern

PROMO design (output)

Type cash credit · % off · free delivery · curated · sub conversion

Amount calibrated to user value $\times$ churn urgency

Timing send window matched to user's order pattern

20% randomized holdout → measures pure incremental lift, validates the hypothesis.

Success metrics (trackable in 60-90 days):

● Retention lift (T vs C)

● Redemption rate

● Incremental GB defended

3-month launch:

Week 1-4 Define & Align (hypothesis validation · stakeholder alignment · tier rules + promo library v1) ·

Week 3-7 Design & Stand Up (A/B test w/ Analytics · sign-off · infra build) ·

Week 6-12 Launch & Monitor (soft → full launch · weekly recalibration · agent skill)

Data we need to instrument

Engine signals (user-level) + LTV validation (placeholders → measurements).

Category A · Engine signals

1

Recency signal

days_since_last_PM_order, per user

Powers churn risk score in tier classifier

2

Frequency-drop signal

(orders_30d / orders_prior_30d) - 1, per user

Quantifies "slipping" — drives At-Risk tier flag

3

Behavioral fingerprint

order_hour × merchant_category mix (last 90d)

Drives promo timing × type matching (BQ dim.)

Category B · LTV validation

1

Cross-platform NetRev per user

sum(NR) for user_id across PM/UE/Rides/Uber One

Replaces: \$148 cross-platform LTV (currently estimated)

2

Sub frequency lift (PM-specific)

(orders/mo, sub) ÷ (orders/mo, non-sub control)

Replaces: 1.8× DD benchmark (borrowed proxy)

3

Causal retention lift

retention(treatment) - retention(holdout)

Replaces: 91% retention proxy (aggregate, not user-level)

All 6 pullable from internal event data + user-level join. Together: takes retention engine from estimate to measurable production system.
